

# Basic Linux for CTFs

---

# What do I need to play?

Challenges may require **linux** to be solved (or at least it can make your life easier).

# So should I change my OS just for CTF?

It's **not necessary** to install linux as your main OS, you have many different options:

- Virtual Machine
- Dual Boot
- WSL2

# Some Linux basics

During CTFs it is **crucial** to know how to use Linux **properly** so let's start with some basics

Here's a command line cheatsheet:

<https://cheatography.com/davechild/cheat-sheets/linux-command-line/>

# Some Linux basics

Often challenges require also **remote connection**. There are many way to do it

- **SSH** → **Secure SHell** is a protocol that allows to establish an encrypted connection that gives us a remote shell
- **netcat** → the TCP and UDP swiss knife
- **curl** → allows remote data transfer in a plethora of protocols

Bandit from OvertheWire is a good way to get started with **linux** for cybersecurity:
